

## Downloading a Data Log File from the Spectra Connect

Our new Spectra Connect controller was designed to make owning and operating a Spectra Watermaker easier than ever. One of the key features and sales points is that your watermaker will keep a log of your operating data. Since this log can be easily exported to an excel file customers can use it to beef up their boat logs or send it out for trouble shooting advice. Viewing and interpreting a data log file can help customers keep a properly maintained system as well as have the appropriate spares on upcoming trips. Below are a couple of examples:

- Your water quality, ppm, has been steadily decreasing so you know it's time to change your membrane.
- You see that your feed pressure has begun to decline with consistent voltage so it might be a good idea to pack a spare pump head for you next trip.

As we start to get more data and customers begin to use their data log files more and more we will inevitably learn more trends and find new ways to foresee upcoming issues.

## How to obtain a data log file from a phone, tablet, or computer:

- Connect your device to the ships Wi-Fi network.
  Note: We suggest that our FSPs and Service Techs carry a Spectra Wireless adapter and/or router when servicing an un-networked Spectra Connect system so they can create a temporary network.
- 2. Find the Spectra connect device IP address.

3. On your device open a web browser and in the address bar type in the Device IP followed by /dataviz.php e.g. 192.168.2.8/dataviz.php. To download, click the Log file link.
